Illustrative concept | Indicative project scope

Morrow

An example of multi-location retail reporting and decision support built on connected operational data.

Context

When inventory, purchasing and transaction data live in separate systems, decisions are slowed by inconsistent reporting. This concept evaluates the data foundations and interfaces that could help teams identify patterns responsibly.

Objectives

- Identify the minimum data required for reliable stock and sales visibility.
- Establish consistent definitions for locations, products, transactions and time periods.
- Support explainable decision-making before considering predictive modelling.

Scope of work

- Discovery: data sources, operational questions, access controls and quality issues.
- Data pipelines: ingestion, normalisation, reconciliation and change tracking.
- Information model: products, locations, stock movements, purchase orders and sales.
- Analysis interface: useful filters, trend comparisons and exception indicators.
- Optional forecasting assessment: evaluate data sufficiency, baseline methods and validation constraints.

Morrow / Scope continued

Expected or implemented deliverables

- A data readiness and integration assessment.
- A proposed data architecture and initial reporting specification.
- Metric definitions and reconciliation/quality controls.
- A staged delivery plan, including whether forecasting is justified.

Boundaries and qualifications

- Morrow is a concept; it is not evidence of a delivered retail client platform.
- No forecast accuracy, financial uplift or production AI capability is asserted.
- Vendor permissions, dataset availability and data-protection requirements need validation.

Document basis

Prepared as an illustrative analytics and business-intelligence scope. No performance metrics have been fabricated.

This document describes a project scope, not a contractual quote, client endorsement or guarantee of results. Commercial delivery, where relevant, requires a separately agreed statement of work.
